

02 – Environment Setup (do this first)

Step 1 – Check licenses (slide 8: LAM provides licenses from Day 1)

Who	License needed	Why
Every app user (requesters, APPG, CCO, stakeholders)	Power Apps Premium (per user) or Per-App	The app uses Dataverse , which is a premium connector
Every report viewer	Power BI Pro (or Premium capacity)	To view shared dashboards
Developers	Power Apps Premium + Power BI Pro (or Developer Plan for Dev)	Build and test
Flow owner (service account)	Power Automate Premium (or covered by Power Apps license in context of the app)	Flows use Dataverse + SharePoint + Outlook

Tip: Use a **service account** (e.g. `svc-tvrms@lam.com`) as owner of all flows and connections. Then emails come from one mailbox and flows don't stop if a developer leaves.

Step 2 – Create 3 environments

Go to <https://admin.powerplatform.microsoft.com> → **Environments** → **+ New**.

Name	Type	Dataverse	Used for
LAM-TVRMS-DEV	Sandbox	Yes	Developers build here
LAM-TVRMS-TEST	Sandbox	Yes	Testing & UAT
LAM-TVRMS-PROD	Production	Yes	Real users

Settings for each: Language = English, Currency = USD, Security group = an Entra ID group like `SG-TVRMS-Users` (so only these people can enter the environment).

Step 3 – Turn on auditing (NFR: all actions auditable, 7 years)

Power Platform admin center → Environment → **Settings** → **Audit and logs** → **Audit settings**:

- ☒ Start auditing
- ☒ Log access
- Retain logs: **Custom** → **2555 days** (= 7 years) (ASSUMPTION; confirm with compliance)

Step 4 – Create a Publisher and a Solution (in DEV)

1. Go to <https://make.powerapps.com> → choose `LAM-TVRMS-DEV`.
2. **Solutions** → **New solution**.
3. Click **New publisher**:
 - Display name: `LAM TVRMS`
 - Name: `lamtvrms`
 - Prefix: `tvr` → every table/column will start with `tvr_` (e.g. `tvr_tvrequest`)
4. Solution name: `TV Request Management System`, Name: `TVRMS`, Version `1.0.0.0`.

Rule: Always create everything (tables, apps, flows, roles, env variables) **inside this solution**. Never in "Default Solution".

Step 5 – Create the SharePoint site

1. Go to SharePoint → **Create site** → **Team site** (or Communication site).
2. Name: **TV Request Management** → URL e.g. `https://lam.sharepoint.com/sites/TVRMS`
3. Create a document library: **TV Requests** (this holds one folder per TVID).
4. Do one site per environment (ASSUMPTION): `TVRMS-DEV`, `TVRMS-TEST`, `TVRMS` (prod).

Details in [04-SharePoint-Document-Management.pdf](#).

Step 6 – Create Environment Variables (inside the solution)

Environment variables let the same solution point to different sites in Dev/Test/Prod.

Display name	Schema name	Type	DEV value (example)
SharePoint Site URL	<code>tvr_SPSiteUrl</code>	Text	<code>https://lam.sharepoint.com/sites/TVRMS-DEV</code>
SharePoint Library	<code>tvr_SPLibrary</code>	Text	<code>TV Requests</code>
App URL	<code>tvr_AppUrl</code>	Text	<code>https://apps.powerapps.com/play/e/.../a/...</code>
APPG Team Email	<code>tvr_APPGEmail</code>	Text	<code>appg-team@lam.com</code>
Admin Email	<code>tvr_AdminEmail</code>	Text	<code>tvrms-admin@lam.com</code>

How: Solution → **New** → **More** → **Environment variable**.

Step 7 – Create Connection References

Solution → **New** → **More** → **Connection reference**. Create one each:

- `tvr_Dataverse` (Microsoft Dataverse)
- `tvr_SharePoint` (SharePoint)
- `tvr_Outlook` (Office 365 Outlook)
- `tvr_Approvals` (Approvals)
- `tvr_Users` (Office 365 Users)
- `tvr_OneDrive` (OneDrive for Business – used for PDF conversion)

All flows must use these connection references.

Step 8 – Create Entra ID security groups (ask IT)

Group	Members (sample)	Linked to
<code>SG-TV RMS-Users</code>	all users	Environment access
<code>SG-TV RMS-Requesters</code>	engineers	Dataverse team → role "TVR Requester"
<code>SG-TV RMS-APPG</code>	APPG team	role "TVR APPG Reviewer"
<code>SG-TV RMS-CCOwners</code>	cost center owners	role "TVR Cost Center Owner"
<code>SG-TV RMS-Admins</code>	IT admins	role "TVR Admin"

Step 9 – Tools on your laptop (optional but useful)

- Microsoft Edge (NFR: must work in Edge)
- **Power BI Desktop** (free, from Microsoft Store)
- **Power Platform CLI** (`pac`) for exporting solutions to source control
- **Visual Studio Code** + "Power Platform Tools" extension
- **Git** – to keep exported solution in this repository (folder `solution/` later)

Checklist

- ☐ Licenses confirmed
- ☐ DEV / TEST / PROD environments created
- ☐ Auditing on, 7-year retention
- ☐ Publisher `tvr` + solution `TVRMS` created
- ☐ SharePoint site + library created
- ☐ Environment variables + connection references created
- ☐ Security groups created
